## PROFESSIONAL SUMMARY

Computer Engineering undergraduate with hands-on experience across the full software lifecycle — building web applications, designing APIs, and deploying containerized services to the cloud. Comfortable working across backend, full-stack, and DevOps environments, with a focus on writing maintainable, production-ready code.

## EDUCATION

**National University of Science and Technology (NUST)**

*Bachelor of Engineering in Computer Engineering*

Islamabad, Pakistan

Sept. 2024 – Sept. 2028

## EXPERIENCE

**RiseTech**

*Software Engineering Intern*

Islamabad, Pakistan

June 2026 – Aug. 2026

- Developed a full-stack FYP evaluation portal with **Next.js**, **TypeScript**, and **MongoDB**, architecting modular, reusable service layers that eliminated redundant DB queries and unnecessary duplicate API calls at the design level — cutting network overhead across the application.
- Implemented JWT authentication, admin and faculty workflows, and CSV import/export with end-to-end evaluation progress tracking, used throughout the university's FYP evaluation cycle.
- Containerized the application with **Docker** and deployed it to **Google Cloud Platform** via **Cloud Build**, replacing manual deployment steps with an automated build-and-deploy pipeline for consistent, repeatable releases.
- Gained foundational exposure to **Firebase** for authentication, real-time data storage, and web application deployment, integrating real-time listeners for live evaluation status updates.

## PROJECTS

**Chaukidar – Multilingual AI Safety Audits** | *Next.js, FastAPI, TypeScript, AI APIs*

[GitHub](#) | [Live Demo](#)

- Built an AI safety audit platform with a **FastAPI** backend that tests language models across English, Urdu, Punjabi, Pashto, and Sindhi in five harm categories.
- Designed a three-track multilingual pipeline with Fireworks and AMD ROCm/vLLM; results revealed distinct refusal and compliance patterns across models and languages.

**Seedha Rasta – Fuel-Optimized Routing Engine** | *Django, React, AWS*

[GitHub](#)

- Engineered a graph-based routing system using A\* with a custom fuel cost function, reducing estimated fuel consumption by **18–25%** over shortest-path routing.
- Deployed containerized services on **AWS ECS** with an Application Load Balancer, GitHub Actions CI/CD, RDS, and Redis, reducing route latency by **~40%**.

**Synthron – AI-Powered PC Builder Platform** | *Django, PostgreSQL, Docker*

[GitHub](#)

- Built an AI-powered PC builder using Django REST Framework, JWT authentication, and LLM-based intent parsing to generate budget-aware recommendations.
- Designed modular CPU, GPU, and RAM recommendation components and containerized the application with **Docker Compose**.

## ACHIEVEMENTS

**AMD Hackathon** | *lablab.ai*

July 2026

- Built **Chaukidar**, a multilingual AI safety audit platform, for the AMD-sponsored track (ROCm/vLLM inference).

## TECHNICAL SKILLS

**Languages:** Python, C++, Java, JavaScript, TypeScript

**Frontend & Backend:** React, Next.js, Express.js, Django

**Databases:** MongoDB, PostgreSQL, Redis, Firebase (Foundational)

**DevOps & Cloud:** Docker, AWS, GitHub Actions, Linux, Git
